- Step 3: Generating 3-itemset Frequent Pattern
- Step 4: Generating 4-itemset Frequent Pattern
- Step 5: Generating Association Rules from Frequent Itemsets

## The Apriori algorithm Key Concepts :

1. Frequent Itemsets: The sets of item which has minimum support (denoted by $\mathbf{L i}$ for ithItemset).
2. Apriori Property: Any subset of frequent itemset must be frequent.
3. Join Operation: To find $\mathbf{L k}$, a set of candidate $k$ itemsets is generated by joining Lk-1 with itself.

Step 1: Mining all frequent itemsets

- A frequent itemset is an itemset whose support is $\geq$ minsup.
- Key idea: any subsets of a frequent itemset are also frequent itemsets

## Definition of Apriori Algorithm

- In computer science and data mining, Apriori is a classic algorithm for learning association rules.
- Apriori is designed to operate on databases containing transactions (for example, collections of items bought by customers, or details of a website frequentation).
- The algorithm attempts to find subsets which are common to at least a minimum number C of the itemsets.

## Definition (contd.)

- Apriori uses a "bottom up" approach, where frequent subsets are extended one item at a time (a step known as candidate generation, and groups of candidates are tested against the data.
- The algorithm terminates when no further successful extensions are found.

## Apriori Algorithm

Uses a Level-wise search, where $k$-itemsets (An itemset that contains $k$ items is a $k$-itemset) are used to explore ( $k+1$ )-itemsets, to mine frequent itemsets from transactional database for Boolean association rules.

First, the set of frequent 1 -itemsets is found. This set is denoted L1. L1 is used to find L2, the set of frequent 2-itemsets, which is used to fine L3, and so on, until no more frequent $k$-itemsets can be found.

## Steps to Perform Apriori Algorithm

## Stepl

Scan the transaction database to get the support $S$ of each 1 -itemset, compare $S$ with min sup, and get a set of frequent 1 -itemsets, $\mathrm{I}_{1}$

## Apriori Algorithm

## Step2 <br> Use $\mathrm{L}_{\mathrm{k}-1}$ join $\mathrm{L}_{\mathrm{k}-1}$ to generate a set of candidate k-itemsets. And use Apriori property to prume the unfiequented k-itemsets from this set

## Step6

For every nonempty subset s of l , output the rule " $s==(1-s)^{\prime \prime}$ if confidenca C of the rule " $s=s(1-s)$ " ( - support $S$ of $1 /$ support S of s) ${ }^{3}$ min_coaf

## Step 3

Scan the transaction datalbase to get the suppoit $S$ of each candidate k -itemset in the final set, compare S with min sup, and get a set of frequent $\bar{k}$-itemsets, $\mathrm{L}_{\mathrm{k}}$

Step4:
The candidate set $=\mathrm{Nu}$

Step5
For each frequent itemset 1 , generate all nonempty subsets of 1

## The Apriori Algorithm: Example

| TID | List of Items |
| :---: | :--- |
| T100 | I1, I2, I5 |
| T100 | I2, I4 |
| T100 | I2, I3 |
| T100 | I1, I2, I4 |
| T100 | I1, I3 |
| T100 | I2, I3 |
| T100 | I1, I3 |
| T100 | I1, I2, I3, I5 |
| T100 | I1, I2, I3 |

- Consider a database, D , consisting of 9 transactions.
- Suppose min.support count required is 2 (i.e. min_sup $=2 / 9=$ 22 \% )
- Let minimum confidence required is $70 \%$.
- We have to first find out the frequent itemset using Apriori algorithm.
- Then, Association rules will be generated using min. support \& min. confidence.

## Step 1: Generating 1-itemset Frequent Pattern

Scan D for
count of each

candidate $\rightarrow$| Itemset | Sup.Count |
| :---: | :---: |
| $\{\mathrm{II}\}$ | 6 |
| $\{\mathrm{I} 2\}$ | 7 |
| $\{\mathrm{I} 3\}$ | 6 |
| $\{\mathrm{I} 4\}$ | 2 |
| $\{\mathrm{I} 5\}$ | 2 |
| $\mathrm{C}_{1}$ |  |

| Compare candidate support count with minimum support count | Itemset | Sup.Count |
| :---: | :---: | :---: |
|  | \{I1\} | 6 |
|  | \{I2\} | 7 |
|  | \{13\} | 6 |
|  | \{I4\} | 2 |
|  | \{I5\} | 2 |
|  | $\mathrm{L}_{1}$ |  |

- In the first iteration of the algorithm, each item is a member of the set of candidate.
- The set of frequent 1-itemsets, $\mathrm{L}_{1}$, consists of the candidate 1-itemsets satisfying minimum support.

## Step 2: Generating 2-itemset Frequent Pattern

| Generate $\mathrm{C}_{2}$ candidates from $L_{1}$ | Itemset | Scan D for count of each candidate | Itemset | Sup. | Compare candidate support count with minimum support count | Itemset | Sup |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | \{I1, I2 \} |  |  |  |  |  |  |
|  | \{I1, I3\} |  | \{I1, I2 $\}$ | 4 |  | \{I1, I2 \} | 4 |
|  | \{I1, I4\} |  | \{I1, I3\} | 4 |  | \{I1, I3 $\}$ | 4 |
|  | \{I1, I5\} |  | \{I1, I4\} | 1 |  | $\{\mathrm{II}, \mathrm{I} 5\}$ | 2 |
|  | \{I2, I3\} |  | \{I1, I5\} | 2 |  | \{I2, I3 \} | 4 |
|  | \{I2, I4\} |  | \{I2, I3\} | 4 |  | $\{\mathrm{I} 2, \mathrm{I} 4\}$ | 2 |
|  | \{I2, I5\} |  | \{I2, I4\} | 2 |  | $\{\mathrm{I} 2,15\}$ | 2 |
|  | $\{13, \mathrm{I} 4\}$ |  | \{I2, I5\} | 2 |  | $\mathbf{L}_{2}$ |  |
|  | $\{13,15\}$ |  | \{I3, I4\} | 0 |  |  |  |
|  | $\{\mathrm{I} 4, \mathrm{I} 5\}$ |  | \{I3, I5 $\}$ | 1 |  |  |  |
|  | $\mathrm{C}_{2}$ |  | \{I4, I5\} | 0 |  |  |  |
|  |  |  | $\mathrm{C}_{2}$ |  |  |  |  |

## Step 2: Generating 2-itemset Frequent Pattern [Cont.]

- To discover the set of frequent 2-itemsets, $\mathrm{L}_{2}$, the algorithm uses $\mathrm{L}_{1}$ Join $\mathrm{L}_{1}$ to generate a candidate set of 2itemsets, $\mathrm{C}_{2}$.
- Next, the transactions in D are scanned and the support count for each candidate itemset in $\mathrm{C}_{2}$ is accumulated (as shown in the middle table).
- The set of frequent 2-itemsets, $\mathrm{L}_{2}$, is then determined, consisting of those candidate 2-itemsets in $\mathrm{C}_{2}$ having minimum support.
- Note: We haven't used Apriori Property yet.

## Step 3: Generating 3-itemset Frequent Pattern

| Generate <br> $\mathrm{C}_{3}$ <br> candidates <br> from $L_{2}$ | Itemset | Scan D for count of each candidate | Itemset | Sup. <br> Count | Compare candidate support count with min support count | Itemset |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Sup Count |
|  | \{I1, I2, I3 $\}$ |  | \{I1, I2, I3 $\}$ | 2 |  | $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3\}$ | 2 |
|  | $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\}$ |  | $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\}$ | 2 |  | $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\}$ | 2 |
|  | $\mathrm{C}_{3}$ |  | C |  |  | $\mathbf{L}_{3}$ |  |

- The generation of the set of candidate 3-itemsets, $\mathrm{C}_{3}$, involves use of the Apriori Property.
- In order to find $\mathrm{C}_{3}$, we compute $\mathrm{L}_{2} \operatorname{Join} \mathrm{~L}_{2}$.
- $\mathrm{C}_{3}=\mathrm{L} 2 \operatorname{Join} \mathrm{~L} 2=\{\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3\},\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\},\{\mathrm{I} 1, \mathrm{I} 3, \mathrm{I} 5\},\{\mathrm{I} 2, \mathrm{I} 3, \mathrm{I} 4\},\{\mathrm{I} 2, \mathrm{I} 3, \mathrm{I} 5\}$, $\{I 2, I 4, I 5\}\}$.
- Now, Join step is complete and Prune step will be used to reduce the size of $C_{3}$. Prune step helps to avoid heavy computation due to large $C_{k}$.

## Step 3: Generating 3-itemset Frequent Pattern [Cont.]

- Based on the Apriori property that all subsets of a frequent itemset must also be frequent, we can determine that four candidates cannot possibly be frequent. How?
- For example , lets take \{I1, I2, I3\}. The 2-item subsets of it are \{I1, I2\}, $\{\mathrm{I} 1, \mathrm{I} 3\} \&\{\mathrm{I} 2, \mathrm{I} 3\}$. Since all 2-item subsets of $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3\}$ are members of $\mathrm{L}_{2}$, We will keep $\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 3\}$ in $\mathrm{C}_{3}$.
- Lets take another example of $\{12, I 3, I 5\}$ which shows how the pruning is performed. The 2 -item subsets are $\{\mathrm{I} 2, \mathrm{I} 3\},\{\mathrm{I} 2, \mathrm{I} 5\} \&\{I 3, \mathrm{I} 5\}$.
- BUT, $\{I 3, I 5\}$ is not a member of $L_{2}$ and hence it is not frequent violating Apriori Property. Thus We will have to remove \{I2, I3, I5\} from $\mathrm{C}_{3}$.
- Therefore, $\mathrm{C}_{3}=\{\{I 1, \mathrm{I} 2, \mathrm{I} 3\},\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\}\}$ after checking for all members of result of Join operation for Pruning.
- Now, the transactions in D are scanned in order to determine $\mathrm{L}_{3}$, consisting of those candidates 3 -itemsets in $\mathrm{C}_{3}$ having minimum support.

## Step 4: Generating 4-itemset Frequent Pattern

- The algorithm uses $\mathrm{L}_{3}$ Join $\mathrm{L}_{3}$ to generate a candidate set of 4 -itemsets, $\mathrm{C}_{4}$. Although the join results in $\{\{11, \mathrm{I} 2, \mathrm{I} 3$, I5\}\}, this itemset is pruned since its subset $\{\{12, I 3, I 5\}\}$ is not frequent.
- Thus, $\mathrm{C}_{4}=\varphi$, and algorithm terminates, having found all of the frequent items. This completes our Apriori Algorithm.
- What's Next ?

These frequent itemsets will be used to generate strong association rules ( where strong association rules satisfy both minimum support \& minimum confidence).

## Step 5: Generating Association Rules from Frequent Itemsets

- Procedure:
- For each frequent itemset " $l$ ", generate all nonempty subsets of $l$.
- For every nonempty subset $s$ of $l$, output the rule "s $\boldsymbol{s}(\mathbf{l}-\mathbf{s})$ " if support_count(l)/ support_count(s) >= min_conf where min_conf is minimum confidence threshold.
- Back To Example:

We had $\mathrm{L}=\{\{\mathrm{I} 1\},\{\mathrm{I} 2\},\{\mathrm{I} 3\},\{\mathrm{I} 4\},\{\mathrm{I} 5\},\{\mathrm{I} 1, \mathrm{I} 2\},\{\mathrm{I} 1, \mathrm{I} 3\},\{\mathrm{II} 1 \mathrm{I} 5\},\{\mathrm{I} 2, \mathrm{I} 3\},\{\mathrm{I} 2, \mathrm{I} 4\}$, \{I2,I5\}, \{I1,I2,I3\}, \{I1,I2,I5\}\}.
O Lets take $l=\{11, \mathrm{I} 2,15\}$.
O Its all nonempty subsets are $\{11, \mathrm{I} 2\},\{11,15\},\{12, I 5\},\{[1\},\{22\},\{15\}$.

Step 5: Generating Association Rules from Frequent Itemsets [Cont.]

- Let minimum confidence threshold is , say $70 \%$.
- The resulting association rules are shown below, each listed with its confidence.
OR1: I1 ^ I2 $\rightarrow$ I5
- Confidence $=\mathrm{sc}\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\} / \mathrm{sc}\{\mathrm{I} 1, \mathrm{I} 2\}=2 / 4=50 \%$
- R1 is Rejected.

OR2: $\mathrm{I} 1 \wedge$ I5 $\rightarrow$ I2

- Confidence $=\operatorname{sc}\{I 1, I 2, I 5\} / s c\{I 1, I 5\}=2 / 2=100 \%$
- R2 is Selected.

OR3: $\mathrm{I} 2{ }^{\wedge} \mathrm{I} 5 \rightarrow \mathrm{I} 1$

- Confidence $=s c\{I 1, I 2, I 5\} / s c\{I 2, I 5\}=2 / 2=100 \%$
- R3 is Selected.

Step 5: Generating Association Rules from Frequent Itemsets [Cont.]
$\bigcirc \mathrm{R} 4: \mathrm{I} 1 \rightarrow \mathrm{I} 2{ }^{\wedge}$ I5

- Confidence $=\operatorname{sc}\{\mathrm{I} 1, \mathrm{I} 2, \mathrm{I} 5\} / \mathrm{sc}\{\mathrm{I} 1\}=2 / 6=33 \%$
- R4 is Rejected.
$\bigcirc$ R5: I2 $\rightarrow$ I1 ${ }^{\wedge}$ I5
- Confidence $=$ sc\{II,I2,I5 $\} /\{\mathrm{I} 2\}=2 / 7=29 \%$
- R5 is Rejected.
$\bigcirc$ R6: I5 $\rightarrow$ I1 ${ }^{\wedge}$ I2
- Confidence $=\operatorname{sc}\{I 1, I 2, I 5\} /\{I 5\}=2 / 2=100 \%$
- R6 is Selected.

In this way, We have found three strong association rules.

## The Apriori Algorithm - Example

Min support = 2

| Database D |  | $C_{1}$ | itemset sup. |  |
| :---: | :---: | :---: | :---: | :---: |
| TID | Items |  | \{1\} | 2 |
| 100 | 134 |  | \{2\} | 3 |
| 200 | 235 | $\xrightarrow{\text { Scan D }}$ | \{3\} | 3 |
| 300 | 1235 |  | \{4\} | 1 |
| 400 | 25 |  | \{5\} | 3 |

$L_{2}$ itemset sup
$\left.\begin{array}{l|l|}\{13 & 3 \\ \{23 & 2 \\ \{2 & 2 \\ \{2 & 3 \\ \{3 & 5\end{array}\right\}$
$C_{2}$ itemset sup

| Scan D ${ }^{C_{2}}$ | itemset |
| :---: | :---: |
|  | \{1 2\} |
|  | \{1 3\} |
|  | \{15\} |
|  | \{2 3\} |
|  | $\{25\}$ |
|  | \{35\} |

$C_{3}$| itemset |
| :---: |
| $\{235\}$ |$\xrightarrow{\text { Scan D }} L_{3}$ itemset | $\{235\}$ |  |
| :---: | :---: |
|  | 2 |

Note: $\{1,2,3\}\{1,2,5\}$ and $\{1,3,5\}$ not in $\mathrm{C}_{3}$

## Example of Apriori Run

## Apriori algorithm example
